

# Linux

[↑ Known Issues](#)

Issue	Solution
<b>HP-UX</b>	
<b>PowerChute fails to shut down HP-UX machine when installed via iLO/MP Console. This can also occur if the PowerChute daemon is restarted via iLO/MP Console.</b>	Do not install or restart the PowerChute daemon using the iLO/MP Console. Either log on directly or use SSH/rlogin to connect remotely.
<b>Solaris</b>	
<b>When configuring the "Notify User" option in PowerChute, if a Single User is chosen, the user does not receive the notification.</b>	Specify All Users when configuring the "Notify User" option.

# Mac OS X Issues

[↑ Known Issues](#)

Issue	Solution
<b>Following silent installation using IPv6 on MAC OSX the event log reports the following error: "ERROR: The ini contains an invalid value for localhostAddress in section Networking."</b>	In SilentInstall.ini add the IPv6 address of the PowerChute machine to the key: "LOCAL_IP_ADDRESS=000.000.000.000" and remove the comment symbol: #. This needs to be done in addition to specifying the IPv6 address in the #UNICAST_ADDRESS= key.
